Report Date	August 28, 2022

Smart Contract Security Audit

About Better Together

The First to Bring Mining & NFT System to Football Lottery.

Support favorite team and make profit together.

Better together is a football lottery protocol specially created for the World Cup. It combines traditional football lottery with Defi to design a very healthy token and NFT ecosystem which allowing investors to fully enjoy the World Cup dividends.

Audit Summary

InterFi team has performed a line-by-line manual analysis and automated review of smart contracts. Smart contracts were analyzed mainly for common contract vulnerabilities, exploits, and manipulation hacks. According to the audit:

- ❖ Better Together's solidity source code has **LOW RISK SEVERITY**
- ❖ Better Together's smart contract has an **ACTIVE OWNERSHIP**
- ❖ Better Together's centralization risk correlated to the active owner is **HIGH**
- ❖ Important contract privileges – **BUY TRAIN, BUY SKILL, LAUNCH, SET ADDRESSES, WHITELIST**
- ❖ High-risk contract privileges – **ADD TRAIN LIQUIDITY, ADD SKILL LIQUIDITY**

Be aware that smart contracts deployed on the blockchain aren't resistant to internal exploit, external vulnerability, or hack. For a detailed understanding of risk severity, source code vulnerability, exploitability, and audit disclaimer, kindly refer to the audit.

📄 Contract address: **0x379c32AbC93214514BcF42a403A1e1cf83A16dA3**

🔗 Blockchain: **Binance Smart Chain**

About InterFi Network	24

Audit Scope

InterFi was consulted by Better Together to conduct the smart contract security audit of their solidity source codes. The audit scope of work is strictly limited to the mentioned solidity file(s) only:

❖ TrainPreSale.sol

Solidity Source Code On Blockchain (Verified Contract Source Code)

<https://bscscan.com/address/0x379c32AbC93214514BcF42a403A1e1cf83A16dA3#code>

Contract Name: TrainPreSale

Compiler Version: v0.7.5

Optimization Enabled: Yes with 200 runs

Audit Hash

Solidity source code is audited at hash #65499af3ab119a256b267603947eace31b7c19a4

Audit Methodology

The scope of this report is to audit smart contract sources code of Better Together. InterFi has scanned contracts and reviewed codes for common vulnerabilities, exploits, hacks, and backdoors. Due to being out of scope, InterFi has not tested contracts on testnet to assess any functional flaws. Below is the list of commonly known smart contract vulnerabilities, exploits, and hacks:

Category

Smart Contract Vulnerabilities

- ❖ Re-entrancy
- ❖ Unhandled Exceptions
- ❖ Transaction Order Dependency
- ❖ Integer Overflow
- ❖ Unrestricted Action
- ❖ Incorrect Inheritance Order
- ❖ Typographical Errors
- ❖ Requirement Violation
- ❖ Gas Limit and Loops

Source Code Review

- ❖ Deployment Consistency
- ❖ Repository Consistency
- ❖ Data Consistency
- ❖ Token Supply Manipulation
- ❖ Access Control and Authorization
- ❖ Operations Trail and Event Generation
- ❖ Assets Manipulation
- ❖ Ownership Control
- ❖ Liquidity Access

InterFi's Echelon Audit Standard

The aim of InterFi's "Echelon" standard is to analyze smart contracts and identify the vulnerabilities and the hacks. Kindly note, InterFi does not test smart contracts on testnet. It is recommended that smart contracts are thoroughly tested prior to the audit submission. Mentioned are the steps used by InterFi to audit smart contracts:

1. Solidity smart contract source code reviewal:
 - ❖ Review of the specifications, sources, and instructions provided to InterFi to make sure we understand the size, and scope of the smart contract audit.
 - ❖ Manual review of code, which is the process of reading source code line-by-line to identify potential vulnerabilities.
2. Static, Manual, and Software analysis:
 - ❖ Test coverage analysis is the process of determining whether the test cases are covering the code and how much code is exercised when we run those test cases.
 - ❖ Symbolic execution is analyzing a program to determine what inputs cause each part of a program to execute.
3. Best practices review, which is a review of the smart contracts to improve efficiency, effectiveness, clarify, maintainability, security, and control based on the established industry and academic practices, recommendations, and research.
4. Specific, itemized, actionable recommendations to help you take steps to secure your smart contracts

Automated 3P frameworks used to assess the smart contract vulnerabilities

- ❖ Consensys Tools
- ❖ SWC Registry
- ❖ Solidity Coverage
- ❖ Open Zeppelin Code Analyzer
- ❖ Solidity Code Compiler

Risk Classification

Smart contracts are generally designed to manipulate and hold funds denominated in ETH/BNB. This makes them very tempting attack targets, as a successful attack may allow the attacker to directly steal funds from the contract. Below are the typical risk levels of a smart contract:

Vulnerable: A contract is vulnerable if it has been flagged by a static analysis tool as such. As we will see later, this means that some contracts may be vulnerable because of a false positive.

Exploitable: A contract is exploitable if it is vulnerable and the vulnerability could be exploited by an external attacker. For example, if the “vulnerability” flagged by a tool is in a function that requires owning the contract, it would be vulnerable but not exploitable.

Exploited: A contract is exploited if it received a transaction on the main network which triggered one of its vulnerabilities. Therefore, a contract can be vulnerable or even exploitable without having been exploited.

Smart Contract Security Audit

Risk severity	Meaning
! High	This level vulnerabilities could be exploited easily and can lead to asset loss, data loss, asset, or data manipulation. They should be fixed right away.
! Medium	This level vulnerabilities are hard to exploit but very important to fix, they carry an elevated risk of smart contract manipulation, which can lead to high-risk severity
! Low	This level vulnerabilities should be fixed, as they carry an inherent risk of future exploits, and hacks which may or may not impact the smart contract execution.
! Informational	This level vulnerabilities can be ignored. They are code style violations and informational statements in the code. They may not affect the smart contract execution

Centralization Risk

Centralization risk is the most common cause of decentralized finance hacks. When a smart contract has an active contract ownership, the risk related to centralization is elevated. There are some well-intended reasons to be an active contract owner, such as:

- ❖ Contract owner can be granted the power to `pause()` or `lock()` the contract in case of an external attack.
- ❖ Contract owner can use functions like, `include()`, and `exclude()` to add or remove wallets from fees, swap checks, and transaction limits. This is useful to run a presale, and to list on an exchange.

Authorizing a full centralized power to a single body can be dangerous. Unfortunately, centralization related risks are higher than common smart contract vulnerabilities. Centralization of ownership creates a risk of rug pull scams, where owners cash out tokens in such quantities that they become valueless. **Most important question to ask here is, how to mitigate centralization risk?** Here's InterFi's recommendation to lower the risks related to centralization hacks:

- ❖ Smart contract owner's private key must be carefully secured to avoid any potential hack.
- ❖ Smart contract ownership should be shared by multi-signature (multi-sig) wallets.
- ❖ Smart contract ownership can be locked in a contract, user voting, or community DAO can be introduced to unlock the ownership.

Better Together's Centralization Status

- ❖ Better Together's smart contract has an **active ownership**.
- ❖ Smart contract ownership is set to **0x4a933106c2bae4dcd6120105016333efb93b00fa** at the time of the audit.

Manual Analysis

Function	Description	Available	Status
Total Supply	provides information about the total token supply	Yes	Passed
Balance Of	provides account balance of the owner's account	Yes	Passed
Transfer	executes transfers of a specified number of tokens to a specified address	Yes	Passed
Approve	allow a spender to withdraw a set number of tokens from a specified account	Yes	Passed
Allowance	returns a set number of tokens from a spender to the owner	Yes	Passed
Buy Back	is an action in which the project buys back its tokens from the existing holders usually at a market price	Yes	Passed
Transfer Ownership	executes transfer of contract ownership to a specified wallet	Yes	Passed
Renounce Ownership	executes transfer of contract ownership to a dead address	Yes	Passed

Notable Information

- ❖ Smart contract sets **mentioned constructor** for presales. Skill LP, and Train LP share should be higher.

```
uint256 public constant MaxAmount = 500000 ether;           // BUSD
uint256 public constant MinAmount = 200000 ether;
uint256 public constant teamReward = 30;                   // 3% for team
uint256 public constant market = 20;                       // 2% for market
uint256 public constant flexibleMarket = 50;               // 5%
uint256 public constant trainLp = 195;                     // 19.5% trainLp
uint256 public constant trainMarket = 455;                 // 45.5% trainMarket
uint256 public constant skillLp = 75;                      // 7.5% skillLp
uint256 public constant skillMarket = 175;                 // 17.5% skillMarket
```

- ❖ Smart contract owner can **set addresses**.

```
function setStaker(address _staker) public onlyOwner(){
    require(_staker != address(0), "invalid address");
}
function setTokenAddress(address _token) public onlyOwner(){
    require(_token != address(0), "invalid address");
    require(trainToken == address(0), "already setted!");
}
function setSkillToken(address _token) public onlyOwner(){
    require(_token != address(0), "invalid address!");
    require(skillToken == address(0), "already setted!");
}
function setNftToken(address _nft) public onlyOwner(){
    require(_nft != address(0), "invalid address!");
    require(nftToken == address(0), "already setted!");
}
function setRebateContract(address _rebate) public onlyOwner{
    require(_rebate != address(0), "reabte: invalid address!");
    require(rebateTool == address(0));
}
```

- ❖ Smart contract owner can **set whitelists**.

```
function setWhitelist(string memory _code) public onlyOwner(){
    require(len(_code) == 12, "invalid Code!");
}
```

- ❖ Smart contract owner adds **train and skill liquidity** manually.

```
function trainLiquidity() public onlyOwner(){
    require(addTrainLiquidity == false, "already added!");
    require(trainToken != address(0), "trainToken: address is zero!");
    require(totalAmount >= MinAmount, "invalid state");
}
```

```

require(complete == true,"not finished!");
IToken(trainToken).mint(address(this),trainAmount);
function skillLiquidity() public onlyOwner(){
    require(addSkillLiquidity == false,"already added!");
    require(skillToken != address(0),"trainToken: address is zero!");
    require(totalAmount >= MinAmount,"invalid state");
    require(complete == true,"not finished!");
    IToken(skillToken).mint(address(this),tokenAmount);
}

```

- ❖ Smart contract utilizes **safemath** function to avoid common smart contract vulnerabilities.

```

string private _name = "BetterTogether";
library SafeMath {
    function add(uint256 a, uint256 b) internal pure returns (uint256) {
        uint256 c = a + b;
        require(c >= a, "SafeMath: addition overflow");
    }
    function sub(uint256 a, uint256 b) internal pure returns (uint256) {
        return sub(a, b, "SafeMath: subtraction overflow");
    }
    function mul(uint256 a, uint256 b) internal pure returns (uint256) {
        uint256 c = a * b;
        require(c / a == b, "SafeMath: multiplication overflow");
    }
    function div(uint256 a, uint256 b) internal pure returns (uint256) {
        return div(a, b, "SafeMath: division by zero");
    }
    function mod(uint256 a, uint256 b) internal pure returns (uint256) {
        return mod(a, b, "SafeMath: modulo by zero");
    }
}

```

Smart Contract Security Audit

- ❖ Smart contract does not utilize **re-entrancy guard** to prevent re-entrant calls.
- ❖ Smart contract does not call **receive()** for fallbacks. It is executed on a call to the contract with empty call data.
- ❖ Smart contract function **addLiquidity()** should send auto liquidity to an inaccessible address.
- ❖ Smart contract has an **informational severity issue** which may or may not create any functional vulnerability.

"Potential Sandwich Attack"

- ❖ Smart contract has a **low severity issue** which may or may not create any functional vulnerability.

"Utilization of block.timestamp"

- ❖ Smart contract has an **informational severity issue** which may or may not create any functional vulnerability.

"Unknown Externally Owned Accounts"

- ❖ Smart contract has an **informational severity issue** which may or may not create any functional vulnerability.

"Public functions that could be declared external"

Risk Status & Radar Chart

Risk Severity	Status
High	No high severity issues identified
Medium	No medium severity issues identified
Low	3 low severity issues identified
Informational	3 informational severity issues identified
Centralization Risk	Active contract ownership identified

Auditor's Verdict

InterFi team has performed a line-by-line manual analysis and automated review of smart contracts. Smart contracts were analyzed mainly for common contract vulnerabilities, exploits, and manipulation hacks. According to the audit:

- ❖ Better Together's smart contract source code has **LOW RISK SEVERITY**
- ❖ Better Together's smart contract has an **ACTIVE OWNERSHIP**
- ❖ Better Together's centralization risk correlated to the active owner is **HIGH**

InterFi

.....

Note for stakeholders

Smart Contract

Security Audit

- ❖ Be aware that active smart contract owner privileges constitute an elevated impact on smart contract safety and security.
- ❖ If the smart contract is not deployed on any blockchain at the time of the audit, the contract can be modified or altered before blockchain development. Verify contract's deployment status in the audit report.
- ❖ Make sure that the project team's KYC/identity is verified by an independent firm.
- ❖ Always check if the contract's liquidity is locked. A longer liquidity lock plays an important role in the project's longevity. It is recommended to have multiple liquidity providers.
- ❖ Examine the unlocked token supply in the owner, developer, or team's private wallets. Understand the project's tokenomics, and make sure the tokens outside of the LP Pair are vested or locked for a longer period.

Important Disclaimer

InterFi Network provides contract development, testing, auditing and project evaluation services for blockchain projects. The purpose of the audit is to analyze the on-chain smart contract source code and to provide a basic overview of the project. **This report should not be transmitted, disclosed, referred to, or relied upon by any person for any purpose without InterFi's prior written consent.**

InterFi provides the easy-to-understand assessment of the project, and the smart contract (otherwise known as the source code). The audit makes no statements or warranties on the security of the code. It also cannot be considered as enough assessment regarding the utility and safety of the code, bug-free status, or any other statements of the contract. While we have used all the data at our disposal to provide the transparent analysis, it is important to note that you should not rely on this report only – we recommend proceeding with several independent audits and a public bug bounty program to ensure the security of smart contracts. **Be aware that smart contracts deployed on a blockchain aren't resistant to external vulnerability, or a hack. Be aware that active smart contract owner privileges constitute an elevated impact on smart contract safety and security. Therefore, InterFi does not guarantee the explicit security of the audited smart contract.**

The analysis of the security is purely based on the smart contracts alone. No applications or operations were reviewed for security. No product code has been reviewed.

This report should not be considered as an endorsement or disapproval of any project or team.

The information provided in this report does not constitute investment advice, financial advice, trading advice, or any other sort of advice and you should not treat any of the report's content as such. Do conduct your due diligence and consult your financial advisor before making any investment decisions.

About InterFi Network

InterFi Network provides intelligent blockchain solutions. InterFi is developing an ecosystem that is seamless and responsive. Some of our services: Blockchain Security, Token Launchpad, NFT Marketplace, etc. **InterFi's mission is to interconnect multiple services like Blockchain Security, DeFi, Gaming, and Marketplace under one ecosystem that is seamless, multi-chain compatible, scalable, secure, fast, responsive, and easy to use.**

InterFi is built by a decentralized team of UI experts, contributors, engineers, and enthusiasts from all over the world. Our team currently consists of 6+ core team members, and 10+ casual contributors. **InterFi provides manual, static, and automatic smart contract analysis, to ensure that project is checked against known attacks and potential vulnerabilities.**
